

49. How will you handle exceptions in your project?

```
java.lang.RuntimeException Create breakpoint : Products not available for the type sports  
at com.javatechie.service.ProductService.lambda$getProductByType$3(Products.java:49) ~[classes/:na]  
at java.base/java.util.Optional.orElseThrow(Optional.java:483) ~[na:na]
```

Changed from runtime time exception to product not found exception as shown below. Line 50.

```
    .filter(list -> !list.isEmpty())  
    .orElseThrow(() -> new ProductNotFoundException("Products not available for the type " + productType))
```

The screenshot shows the code editor of an IDE with the file `ErrorDto.java` open. The code defines a class `ErrorDto` with three private fields: `status`, `errorMessage`, and `statusCode`. The code is annotated with `@Data`, `@AllArgsConstructor`, `@NoArgsConstructor`, and `@Builder`.

```
import lombok.Data;
import lombok.NoArgsConstructor;
import org.springframework.http.HttpStatus;

@Data
@AllArgsConstructor
@NoArgsConstructor
@Builder
public class ErrorDto {

    private String status;
    private String errorMessage;
    private HttpStatus statusCode;
}
```

The screenshot shows the code editor of an IDE with the file `ProductExceptionHandler.java` open. It contains a single method `handleProductNotFoundException` annotated with `@ExceptionHandler` for the exception `ProductNotFoundException`. The method returns an `ErrorDto` object built from the provided `ProductNotFoundException` object.

```
import org.springframework.http.ResponseEntity;
import org.springframework.web.bind.annotation.ExceptionHandler;
import org.springframework.web.bind.annotation.RestControllerAdvice;

@RestControllerAdvice
public class ProductExceptionHandler {

    @ExceptionHandler(ProductNotFoundException.class)
    public ErrorDto handleProductNotFoundException(ProductNotFoundException ex) {
        return ErrorDto.builder()
            .status("FAIL")
            .errorMessage(ex.getMessage())
            .statusCode(HttpStatus.INTERNAL_SERVER_ERROR).build();
    }
}
```

The screenshot shows a browser window displaying a JSON response. The response is a single object with three properties: `status` set to "FAIL", `errorMessage` set to "Products not available for the type sports", and `statusCode` set to "INTERNAL_SERVER_ERROR".

```
{
  "status": "FAIL",
  "errorMessage": "Products not available for the type sports",
  "statusCode": "INTERNAL_SERVER_ERROR"
}
```

How to handle product already exist exception

```

30
31     public List<Product> saveProduct(Product product) {
32         boolean containsProductId = productList.stream()
33             .map(Product::getId)
34             .anyMatch(productId -> productId.equals(product.getId()));
35
36         if (!containsProductId) {
37             productList.add(product);
38         } else {
39             throw new RuntimeException("Product code already exist in system ! " + product.getId());
40         }
41
42     }

```

POST http://localhost:8181/products

Body (JSON)

```

1 {
2   "id": "83hfdudh",
3   "name": "Head-phone",
4   "price": 900,
5   "model": "JBL T350",
6   "productType": "Education"
7 }

```

500 Internal Server Error 63 ms 263 B Save as example

Pretty Raw Preview Visualize JSON

```

1 {
2   "timestamp": "2024-01-12T05:56:54.194+00:00",
3   "status": 500,
4   "error": "Internal Server Error",
5   "path": "/products"
6 }

```

```

1 package com.javatechie.handler;
2
3 public class DuplicateProductException extends RuntimeException{
4
5     public DuplicateProductException(String message) {
6         super(message);
7     }
8 }

```

Now change from runtime exception to duplicate product exception

```

31
32     public List<Product> saveProduct(Product product) {
33         boolean containsProductId = productList.stream()
34             .map(Product::getId)
35             .anyMatch(productId -> productId.equals(product.getId()));
36
37         if (!containsProductId) {
38             productList.add(product);
39         } else {
40             throw new DuplicateProductException("Product code already exist in system ! " + product.getId());
41
42     }

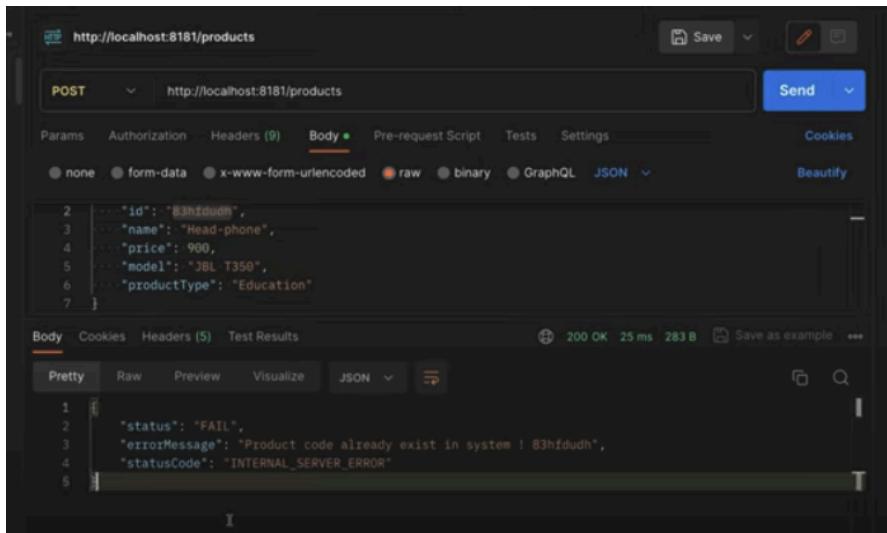

```

Add the below method in controller advice.

```

21
22 @ExceptionHandler(DuplicateProductException.class)
23 public ErrorDto handleDuplicateProductException(DuplicateProductException ex) {
24     return ErrorDto.builder()
25         .status("FAIL")
26         .errorMessage(ex.getMessage())
27         .statusCode(HttpStatus.INTERNAL_SERVER_ERROR).build();
28 }
29

```

In case of spring boot 3. No need for ErrorDto in controller advice. Instead use ProblemDetail as return type as shown below.

```

13
14
15 @ExceptionHandler(ProductNotFoundException.class)
16 public ProblemDetail handleProductNotFoundException(ProductNotFoundException ex) {
17     // ...
18     return ErrorDto.builder()
19         .status("FAIL")
20         .errorMessage(ex.getMessage())
21         .statusCode(HttpStatus.INTERNAL_SERVER_ERROR).build();
22
23
24
25 @ExceptionHandler(DuplicateProductException.class)
26 public ProblemDetail handleDuplicateProductException(DuplicateProductException ex) {
27     // ...
28     return ErrorDto.builder()
29         .status("FAIL")
30         .errorMessage(ex.getMessage())
31         .statusCode(HttpStatus.INTERNAL_SERVER_ERROR).build();
32

```

```
{  
    "type": "about:blank",  
    "title": "Internal Server Error",  
    "status": 500,  
    "detail": "Products not available for the type fashion",  
    "instance": "/products/search/fashion"  
}
```

50. How can you avoid defining handlers for multiple exceptions, or what is the best practice for handling exceptions ?

Is it good practice having n number of handler methods in controller advice?. What is best practise.

```
54  
55     public String fetchLocation(boolean flag, String storeId) {  
56  
57         if (flag) {  
58             //fetch from application DB  
59             //logic  
60             throw new DataRetrievalFailureException("Store not available in system with storeId " + storeId);  
61         } else {  
62             //do rest api call to fetch store info by ID  
63             //logic  
64             throw new HttpClientErrorException(HttpStatus.INTERNAL_SERVER_ERROR,  
65                     "Rest client error occurred while fetching store information");  
66         }  
67     }
```

Suppress any kind of exception in more generic form, instead of throw two different exception through only one exception.

```
1 package com.javatechie.handler;  
2  
3 public class ProductServiceException extends RuntimeException {  
4  
5     public ProductServiceException(String message) {  
6         super(message);  
7     }  
8 }
```

```
public String fetchLocation(boolean flag, String storeId) {
    try {
        if (flag) {
            //fetch from application DB
            //logic
            throw new DataRetrievalFailureException("Store not available in system with storeId " + storeId);
        } else {
            //do rest api call to fetch store info by ID
            //logic
            throw new HttpClientErrorException(HttpStatus.INTERNAL_SERVER_ERROR,
                    "Rest client error occurred while fetching store information");
        }
    } catch (Exception exception) {
        throw new ProductServiceException(exception.getMessage());
    }
}
```

```
@ExceptionHandler(ProductServiceException.class)
public ProblemDetail handleProductServiceException(ProductServiceException ex) {
    return ErrorDto.builder()
        .status("FAIL")
        .errorMessage(ex.getMessage())
        .statusCode(HttpStatus.INTERNAL_SERVER_ERROR).build();
}

return ProblemDetail.forStatusAndDetail(HttpStatus.INTERNAL_SERVER_ERROR, ex.getMessage());
}
```

```
{
  "type": "about:blank",
  "title": "Internal Server Error",
  "status": 500,
  "detail": "Store not available in system with storeId 23490",
  "instance": "/products/stores/true/23490"
}
```

```
{
  "type": "about:blank",
  "title": "Internal Server Error",
  "status": 500,
  "detail": "500 Rest client error occurred while fetching store information",
  "instance": "/products/stores/false/23490"
}
```

51. How will you validate or sanitize your input payload ?

And

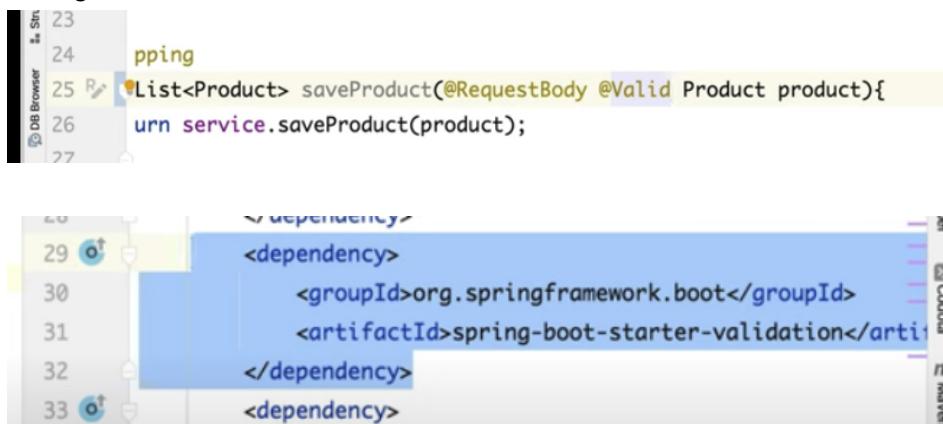

52. How can you populate validation error message to the end users?

Bean validation

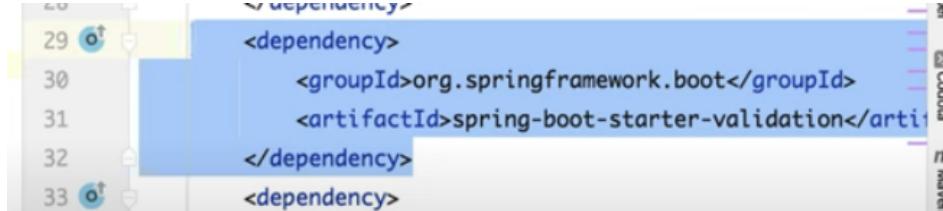

```
@PostMapping  
public List<Product> saveProduct(@RequestBody Product product){  
    return service.saveProduct(product);  
}
```

Change it to

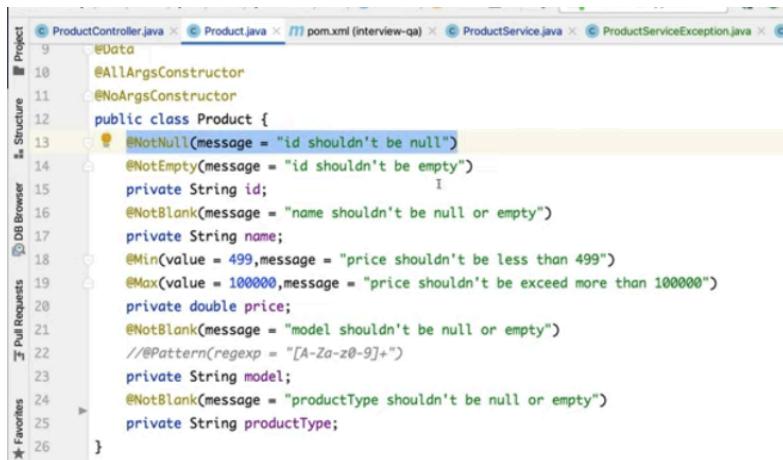

```
pping  
List<Product> saveProduct(@RequestBody @Valid Product product){  
    return service.saveProduct(product);
```

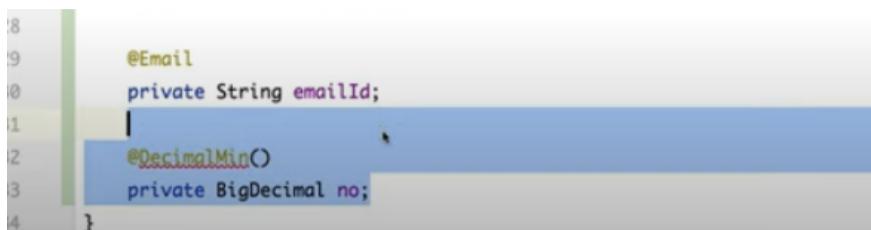

```
<dependency>  
    <groupId>org.springframework.boot</groupId>  
    <artifactId>spring-boot-starter-validation</artifactId>  
</dependency>
```

Number of validations in the product.java

```
@Data  
@AllArgsConstructor  
@NoArgsConstructor  
public class Product {  
    @NotNull(message = "id shouldn't be null")  
    @NotEmpty(message = "id shouldn't be empty")  
    private String id;  
    @NotBlank(message = "name shouldn't be null or empty")  
    private String name;  
    @Min(value = 499,message = "price shouldn't be less than 499")  
    @Max(value = 100000,message = "price shouldn't be exceed more than 100000")  
    private double price;  
    @NotBlank(message = "model shouldn't be null or empty")  
    //@Pattern(regexp = "[A-Za-z0-9]+")  
    private String model;  
    @NotBlank(message = "productType shouldn't be null or empty")  
    private String productType;
```

Email, Decimal min and Decimal max

```
@Email  
private String emailId;  
|  
@DecimalMin()  
private BigDecimal no;
```

AssertTrue or AssertFalse for boolean

```
32
33     @AssertFalse
34
35     @AssertTrue
36     private boolean isActive;
37
38     @Future
39     @Past
     private Date birthDate;
```

Let us validate above validations

Product(com.javatechie.dto.Product) with 3 errors: [Field error in object 'product' on field 'name': rejected value [null]; codes [NotNull,NotNull.message], arguments [{}]; default message [name shouldn't be null or empty]] [Field error in object 'product' on field 'price': rejected value [200.0]; codes [Min.product.price,Min.product.price.message], arguments [{}]; default message [price shouldn't be less than 499]] [Field error in object 'product' on field 'model': rejected value [null]; codes [NotNull,NotNull.message], arguments [{}]; default message [model shouldn't be null or empty]]

```
19     @NotBlank(message = "name shouldn't be null or empty")
20     private String name;
21     @Min(value = 499,message = "price shouldn't be less than 499")
22     @Max(value = 100000,message = "price shouldn't be exceed more than 100000")
23     private double price;
24     @NotBlank(message = "model shouldn't be null or empty")
```

```
20     private String name;
21     @Min(value = 499,message = "price shouldn't be less than 499")
22     @Max(value = 100000,message = "price shouldn't be exceed more than 100000")
23     private double price;
24     @NotBlank(message = "model shouldn't be null or empty")
```

We only see this in the console. Let us map this as a client response.

```
et : Initializing Servlet 'dispatcherServlet'
et : Completed initialization in 3 ms
nResolver : Resolved [org.springframework.web.bind.MethodArgumentNotValidException: Validation failed for c
```

Add handler for this

```
49     @ExceptionHandler(MethodArgumentNotValidException.class)
50     public Map<String, String> handleMethodArgumentNotValidException(MethodArgumentNotValidException ex) {
51         Map<String, String> errorMap = new HashMap<>();
52         ex.getBindingResult().getFieldErrors()
53             .forEach(error -> {
54                 errorMap.put(error.getField(), error.getDefaultMessage());
55             });
56         return errorMap;
57     }
58 }
```

Now we are getting that errors as response

The screenshot shows a Postman interface with a POST request to `http://localhost:8181/products`. The request body contains the following JSON:

```
1 {
2     "id": "",
3     "name": null,
4     "price": 200,
5     "model": "JBL T350",
6     "productType": "Education"
```

The response tab shows a 200 OK status with a response time of 394 ms and a size of 278 B. The response body is:

```
1 {
2     "price": "price shouldn't be less than 499",
3     "name": "name shouldn't be null or empty",
4     "id": "id shouldn't be empty"
5 }
```

53. How can you define custom bean validation ?

Create annotation as follows.

```

1 package com.javatechie.validation;
2
3 import jakarta.validation.Constraint;
4 import jakarta.validation.Payload;
5
6 import java.lang.annotation.*;
7
8 @Target({ElementType.FIELD, ElementType.PARAMETER})
9 @Retention(RetentionPolicy.RUNTIME)
10 @Documented
11 @Constraint(validatedBy = ProductTypeValidator.class)
12 public @interface ValidateProductType {
13
14     public String message() default "Invalid productType: It should be either Electronics OR Education OR Baby&Kids";
15
16     Class<?>[] groups() default {};
17
18     Class<? extends Payload> payload() default {};
19 }

```

And create a class like this and override isValid

```

4 import jakarta.validation.ConstraintValidatorContext;
5
6 import java.util.Arrays;
7 import java.util.List;
8
9 public class ProductTypeValidator implements ConstraintValidator<ValidateProductType, String> {
10     @Override
11     public boolean isValid(String productType, ConstraintValidatorContext constraintValidatorContext) {
12         List<String> productTypes = Arrays.asList("Electronics", "Education", "Baby&Kids");
13         return productTypes.contains(productType);
14     }
15 }

```

Use annotation on the field as shown below

```

26     private String model;
27     @NotBlank(message = "productType shouldn't be null or empty")
28     @ValidateProductType
29     private String productType;
30

```

Now see the error response.

POST http://localhost:8181/products

Body (JSON)

```
{
  "id": "",
  "name": null,
  "price": 200,
  "model": "JBL T350",
  "productType": "Fashion"
}
```

200 OK 368 ms 373 B Save as example

```
{
  "price": "price shouldn't be less than 499",
  "name": "name shouldn't be null or empty",
  "id": "id shouldn't be empty",
  "productType": "Invalid productType: It should be either Electronics OR Education OR Baby&Kids"
}
```

54. use case : let's say you find a bug in production environment and now you want to debug that scenario ,How can you do that from your local ?

Spring profile

We have two schema

Project: Interview-QA

application-prod.properties

```

spring.datasource.driver-class-name=com.mysql.cj.jdbc.Driver
spring.datasource.url = jdbc:mysql://localhost:3306/javatechie_prod
spring.datasource.username = root
spring.datasource.password = Password
spring.jpa.hibernate.ddl-auto = update

spring.jpa.properties.hibernate.dialect = org.hibernate.dialect.MySQLDialect
spring.jpa.hibernate.naming.physical-strategy=org.hibernate.boot.model.nam

```

```

javatechie
  ...
  config
    AppConfig
    CorsConfig.java
    DataSourceConfig
    KafkaConfig
    SecurityConfig
    SwaggerConfig
    WebClientConfig
    WebConfig.java
  ...
  controller
  ...
  dto
  ...
  entity
  ...
  exception
  ...
  handler

import org.springframework.context.annotation.Profile;
import org.springframework.context.annotation.Configuration;

@Configuration
public class KafkaConfig {

    @Bean
    @Profile("dev")
    public KafkaProps devKafkaProps() {
        KafkaProps props = new KafkaProps(bootstrapServers: "2.237.64.90:8181", port: 8181, topicName: "dev-user-topic");
        System.out.println("dev bean initialized!");
        return props;
    }

    @Bean
    @Profile("stg")
    public KafkaProps stgKafkaProps() {
        KafkaProps props = new KafkaProps(bootstrapServers: "200.40.7.181:8282", port: 8282, topicName: "stg-user-topic");
        System.out.println("stg bean initialized!");
        return props;
    }

    @Bean
    @Profile("prod")
    public KafkaProps prodKafkaProps() {
        ...
    }
}

```

```

spring.profiles.active = prod

```

POST http://localhost:8181/users

Body

```

1 {
2   "name": "Basant",
3   "age": 31
4 }

```

Pretty Raw Preview Visualize JSON

```

1 {
2   "id": 1,
3   "name": "Basant",
4   "age": 31
5 }

```

table got created in the prod db and record inserted

DBeaver 21.1.4 - UserDetails

Database Navigator

UserDetails

	id	age	name
	1	31	Basant

Update it to stage and try

```
32  
33  spring.profiles.active = stg|
```

We see stage kafka got initialized in console

The screenshot shows an IDE interface with several tabs at the top: DemoController.java, application.properties, application-stg.properties, application-prod.properties, KafkaConfig.java, ValidateProductType.java, and ProductService.java. The KafkaConfig.java tab is active. The code contains two methods: stgKafkaProps and KafkaProps. The stgKafkaProps method is annotated with @Profile("stg") and prints "stg bean initialized!". The KafkaProps method is annotated with @Bean and @Profile("prod"). Below the code, a terminal window shows logs from a Spring application. It includes a warning message about Swagger configuration and a log entry stating "stg bean initialized!" followed by the timestamp "2024-01-12T12:55:23.004+05:30".

The screenshot shows a Postman request to "http://localhost:8181/users". The method is POST, and the URL is http://localhost:8181/users. The "Body" tab is selected, showing a JSON payload:

```
1 {  
2   "name": "Santosh",  
3   "age": 33  
4 }
```

The response tab shows a 201 Created status with a response body:

```
1 {  
2   "id": 1,  
3   "name": "Santosh",  
4   "age": 33  
5 }
```

55. How can you enable a specific environment without using profiles? OR what is the alternative to profiles to achieving same use case ?

```

29
30     app.active.env= prod
31
32
33     #spring.profiles.active = stag

```

There are n number conditional annotations available for this purpose. We can choose based on requirements

```

1 import org.springframework.context.annotation.Profile;
2
3 @Configuration
4 @Conditional
5 ConditionalOnDefaultWebSecurity org.springframework.boot.autoconfigure.security.SecurityProfiles
6 ConditionalOnDiscoveryEnabled org.springframework.cloud.client.discovery.DiscoveryProfiles

56. What is the difference between @Profile & Conditional

Profile is only for dev, stage or prod

Conditional is for bean creation and configurations based on requirements

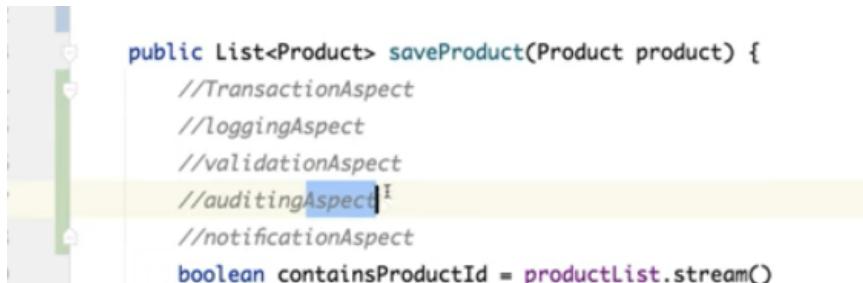

57. What is AOP ?

58. What is pointcut & join Points in AOP

Separate cross cutting concerns which means separate secondary logic from main business logic like logging , validation , transaction related code, auditing and notification related work.

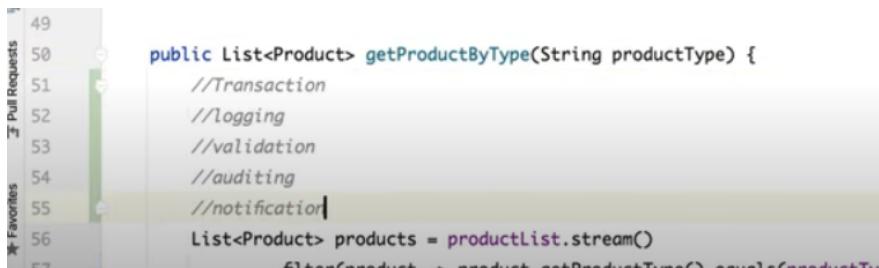

Without this also my code can run. Why to mix cross cutting concerns and business concerns.

1st method same code which is not critical to business

```
public List<Product> saveProduct(Product product) {  
    //TransactionAspect  
    //loggingAspect  
    //validationAspect  
    //auditingAspect  
    //notificationAspect  
    boolean containsProductId = productList.stream()
```

2nd method, same code and so on.

```
49  
50  
51  
52  
53  
54  
55  
56  
public List<Product> getProductByType(String productType) {  
    //Transaction  
    //logging  
    //validation  
    //auditing  
    //notification  
    List<Product> products = productList.stream()
```

Joint point means where we want to implement a specific aspect. (in other words in which method)

Point cut is expression tells who is my joinpoint

59. What are different type of advice ?

- Before Advice
- After Advice
- After Returning Advice
- After Throwing Advice
- Around Advice

60. use case - can I use AOP to evaluate performance of a method or is this possible to design a logging framework to capture request and response body of a method ?

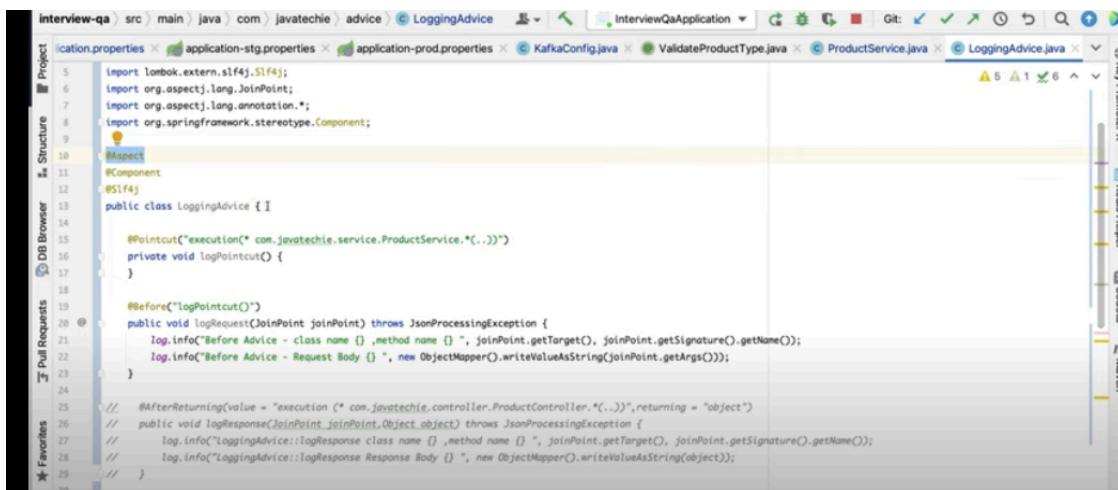

Before Advice executes before join point method execution.

After Advice executes after join point method execution. Even exception in the method this will execute

After Returning Advice: This will execute after successful return. If any exception occurs in the middle of the code then it will not execute.

After Throwing Advice: In case of any exception in the middle of the method then it will execute.

AroundAdvice: Before Advice + After Returning Advice. If we want preprocessing and post processing at the same time then go for AroundAdvice.

```
import lombok.extern.slf4j.Slf4j;
import org.aspectj.lang.JoinPoint;
import org.aspectj.lang.annotation.*;
import org.springframework.stereotype.Component;

@Aspect
@Component
@Slf4j
public class LoggingAdvice {

    @Pointcut("execution(* com.javatechie.service.ProductService.*(..))")
    private void logPointcut() {}

    @Before("logPointcut()")
    public void logRequest(JoinPoint joinPoint) throws JsonProcessingException {
        log.info("Before Advice - class name {} ,method name {} ", joinPoint.getTarget(), joinPoint.getSignature().getName());
        log.info("Before Advice - Request Body {} ", new ObjectMapper().writeValueAsString(joinPoint.getArgs()));
    }

    // @AfterReturning(value = "execution (* com.javatechie.controller.ProductController.*(..),returning = \"object\")")
    // public void logResponse(JoinPoint joinPoint, Object object) throws JsonProcessingException {
    //     log.info("LoggingAdvice::logResponse class name {} ,method name {} ,joinPoint.getTarget(), joinPoint.getSignature().getName()");
    //     log.info("LoggingAdvice::logResponse Response Body {} ", new ObjectMapper().writeValueAsString(object));
    // }
}
```

Create aspect class and annotate with `@Aspect`

Pointcut given at the constructor level => point cut means where it has to be executed.

Or we can define pointcut at method level as shown below.

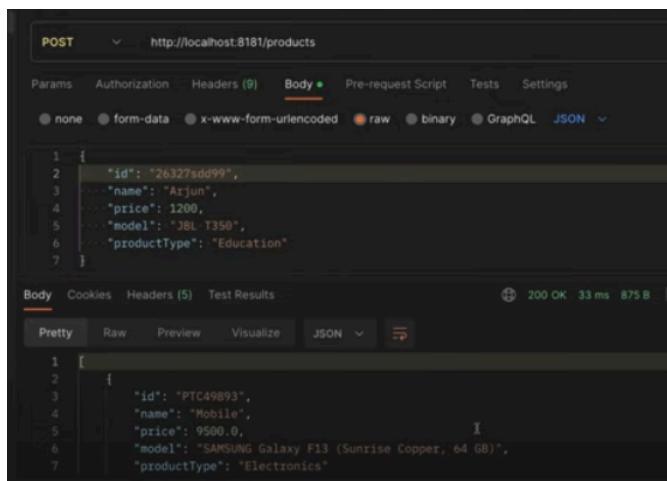

We can include method Name also in the pointcut expression after class Name.

(for eg: `ProductService.saveProduct(..)`)

```

26 // log.info("LoggingAdvice::logResponse Response Body {}", new ObjectMapper().writeValueAsString(result));
27 // }
28
29
30
31     @After(value = "execution(* com.javatechie.service.ProductService.*(..))")
32     public void logResponse(JoinPoint joinPoint) throws JsonProcessingException {
33         log.info("After Advice - LoggingAdvice::logResponse class name {} ,method name {}", joinPoint.getSignature().getDeclaringTypeName(), joinPoint.getSignature().getName());
34         log.info("After Advice - LoggingAdvice::logResponse Response Body {}", new ObjectMapper().writeValueAsString(result));
35     }
36
37
38     @AfterThrowing(value = "execution(* com.javatechie.service.ProductService.*(..))")
39     public void logError(JoinPoint joinPoint) throws JsonProcessingException {
40         log.info("Throws Advice - LoggingAdvice::logResponse class name {} ,method name {}", joinPoint.getSignature().getDeclaringTypeName(), joinPoint.getSignature().getName());
41         log.info("Throws Advice - LoggingAdvice::logResponse Response Body {}", new ObjectMapper().writeValueAsString(result));
42     }

```

```

11
12     @Component
13     @Slf4j
14     public class LoggingAdvice {
15
16         @Pointcut("execution(* com.javatechie.service.ProductService.*(..))")
17         private void logPointcut() {
18     }

```

Run: InterviewQaApplication

Step	Thread	Log Message
1	nio-8181-exec-4	com.javatechie.advice.LoggingAdvice : Before Advice - class name com.javatechie.service.ProductService@1bd5b1c8 ,method name saveProduct
2	nio-8181-exec-4	com.javatechie.advice.LoggingAdvice : Before Advice - Request Body [{"id": "26327sdd99", "name": "Arjun", "price": 1200.0, "model": "JBL T350", "productType": "Education"}]
3	nio-8181-exec-4	com.javatechie.advice.LoggingAdvice : After Advice - LoggingAdvice::logResponse class name com.javatechie.service.ProductService@1bd5b1c8 ,method name saveProduct
4	nio-8181-exec-4	com.javatechie.advice.LoggingAdvice : After Advice - LoggingAdvice::logResponse Response Body [{"id": "26327sdd99", "name": "Arjun", "price": 1200.0, "model": "JBL T350", "productType": "Education"}]

We can clearly see before and after advice methods executed successfully.

If any exception After returning wont executes as shown below
Let us add user with same id

POST http://localhost:8181/products

Body (JSON)

```
{
  "id": "26327sdd99",
  "name": "Arjun",
  "price": 1200,
  "model": "JBL T350",
  "productType": "Education"
}
```

500 Internal Server Error 48 ms 313 B

```
{
  "type": "about:blank",
  "title": "Internal Server Error",
  "status": 500,
  "detail": "Product code already exist in system ! 26327sdd99",
  "instance": "/products"
}
```

Notice after returning is not printed as we have an exception.

```
@AfterReturning(value = "execution (* com.javatechie.service.ProductService.*(..))")
public void logResponse(JoinPoint joinPoint) throws JsonProcessingException {
    log.info("After Advice - LoggingAdvice::logResponse class name {} ,method name {} ", joinPoint.getSignature().getDeclaringTypeName(), joinPoint.getSignature().getName());
    log.info("After Advice - LoggingAdvice::logResponse Response Body {}", new ObjectMapper().writeValueAsString(joinPoint.getArgs()));
}

@Around("@annotation(com.javatechie.annotation.TrackExecutionTime)")
public Object logExecutionDuration(ProceedingJoinPoint pjp) throws Throwable {
    //before advice
    long startTime = System.currentTimeMillis();
    Object obj = pjp.proceed();
    //after advice
    long endTime = System.currentTimeMillis();
    log.info(" method {} execution takes {} ms times to complete ", pjp.getSignature().getName(), (endTime - startTime));
}
```

60. use case - can I use AOP to evaluate performance of a method or is this possible to design a logging framework to capture request and response body of a method ?

In this case we want some pre process logic and post process logic so let us take around advice

```
@Aspect
@Component
@Slf4j
public class LogExecutionTracker {

    @Around("@annotation(com.javatechie.annotation.TrackExecutionTime)")
    public Object logExecutionDuration(ProceedingJoinPoint pjp) throws Throwable {
        //before advice
        long startTime = System.currentTimeMillis();
        Object obj = pjp.proceed();
        //after advice
        long endTime = System.currentTimeMillis();
        log.info(" method {} execution takes {} ms times to complete ", pjp.getSignature().getName(), (endTime - startTime));
    }
}
```

Another example to log the input and output

```

10  @Aspect
11  @Component
12  @Slf4j
13  public class LogPayloadAdvice {
14
15      @Around("@annotation(com.javatechie.annotation.LogPayloads)")
16      public Object logPayloads(ProceedingJoinPoint pjp) throws Throwable {
17          //before advice
18          log.info("Request Body {}", new ObjectMapper().writeValueAsString(pjp.getArgs()));
19          Object obj = pjp.proceed();
20          //after advice
21          log.info("Response Body {}", new ObjectMapper().writeValueAsString(pjp.getArgs()));
22          return obj;
23      }

```

```

1 package com.javatechie.annotation;
2
3 import ...
4
5
6 @Target(ElementType.METHOD)
7 @Retention(RetentionPolicy.RUNTIME)
8 public @interface TrackExecutionTime {
9     }

```

Add these annotations on any method and test

```

33
34  //joinpoint
35  //pointcut (com.javatechie.service.saveProduct.*())
36  @TrackExecutionTime
37  @LogPayloads
38  public List<Product> saveProduct(Product product) {
39      //TransactionAspect
40      //loggingAspect
41      //validationAspect
42      //auditingAspect
43      //notificationAspect
44      boolean containsProductId = productList.stream()
45          .map(Product::getId)
46          .anyMatch(productId -> productId.equals(product.getId()));
47      if (!containsProductId) {

```

Execution Trace	Description
181-exec-1] com.javatechie.advice.LogPayloadAdvice	: Request Body [{"id": "26327sdd99", "name": "Arjun", "price": 1000}
181-exec-1] com.javatechie.advice.LoggingAdvice	: Before Advice - class name com.javatechie.service.ProductService
181-exec-1] com.javatechie.advice.LoggingAdvice	: Before Advice - Request Body [{"id": "26327sdd99", "name": "Arjun", "price": 1000}]
181-exec-1] com.javatechie.advice.LoggingAdvice	: After Advice - LoggingAdvice::logResponse class name com.javatechie.service.ProductService
181-exec-1] com.javatechie.advice.LoggingAdvice	: After Advice - LoggingAdvice::logResponse Response Body [{"id": "26327sdd99", "name": "Arjun", "price": 1000}]
181-exec-1] com.javatechie.advice.LogPayloadAdvice	: Response Body [{"id": "26327sdd99", "name": "Arjun", "price": 1000}]
181-exec-1] c.javatechie.advice.LogExecutionTracker	: method List com.javatechie.service.ProductService.saveProduct([{"id": "26327sdd99", "name": "Arjun", "price": 1000}])

This contains all input and output of the method and what is the performance

```
"model":"JBL T350","productType":"Education"}]  
e@40AAF656 ,method name saveProduct  
, "price":1200.0,"model":"JBL T350","productType":"Education"}]  
chie.service.ProductService@40AAF656 ,method name saveProduct  
"26327sdd99", "name": "Arjun", "price":1200.0,"model":"JBL T350","productType":  
,"model":"JBL T350","productType":"Education"}]  
Product) execution takes 41 ms times to complete
```
